

Protect against vaccine nanobots

If you don't want your life turned into a debilitating existence or wind up dead consider the protective measures needed, especially the protection needed for the vulnerable, such as the children and elderly.

It has been said that there are a number of protective solutions that will destroy the so-called vaccine nano-bots and their replication capabilities. Treatment solutions include

EDTA/Vitamin C
Methylene blue
Nicotine patches
Hydroxychloroquine
Ivermectin.

It's up to you to do your own research and find solutions. Then, from what you have learned, spread your words of warning and protection to others; shine some light in these darkest days.
